

PALADIN®

Plant Back Interval

•Soil Temperature

The soil temperature at the depth of injection must not be less than 45° F or exceed 90° F at the beginning of the application

•Planting Intervals following application

The planting interval should be determined based on **mean daily low** soil temperature at 8" depth.

| Soil Temperature | Planting Intervals following application |
|------------------|--|
| 50 – 54°F | 42 days after treatment |
| 55 – 60°F | 35 days after treatment |
| 61 – 70°F | 28 days after treatment |
| 71°F and higher | 21 days after treatment |

The length of time may vary for PALADIN® to dissipate from the soil before transplanting and seeding safely. Circumstances which do not favor the dissipation of PALADIN® can lengthen the plant-back interval. The plant-back interval is lengthened with (1) heavy soil, (2) low soil temperatures, (3) high soil moisture.
