

# Give your corn the strength to stand up to insects with new Bifenture<sup>®</sup> LFC

- **Effective tool against rootworms, wireworms and other major pests**
- **Enhances protection from damage caused by Bt resistant insects**
- **No closed system or special handling requirements**
- **Compatible with pop-up or starter fertilizers**

## **Protecting Your Investment**

You invest a lot of time and money into growing your corn crop. Bifenture LFC (Liquid Fertilizer Compatible) insecticide adds value to that investment by enhancing insect control at the most critical stage of your crop – when you plant the seed. As a contact insecticide, Bifenture LFC adds an extra layer of protection to stop insects, including Bt resistant species, before they cause damage to seeds and early root development. Providing your corn crop a better foundation to produce its maximum yield potential.

## **Saving You Time and Money**

In addition to enhanced insect protection, Bifenture LFC delivers true savings by reducing your application costs. Since Bifenture LFC can be mixed with pop-up or starter fertilizers, you can reduce the number of field application passes that would be required to apply other, less compatible, insecticides. Bifenture LFC is labeled with a “Caution” signal word and requires no special packaging or closed systems during application. This is an important feature compared to many other corn soil insecticides that require specialized closed system equipment.
